Software Engineering Laboratory, R.O. Korea

Software Product Line Engineering

Prologue

- Soft software lives long; Hard software has no life
- We are developing software as if it is hardware
- Product line software engineering is about making **software soft**
- Product line engineering shows what software engineering ought to be

POSTECH

POSTECH, R.O. Korea

3

Software Product Line Engineering

Software Product Line Engineering

But what happens

- Software maintenance requires
 - Adding new functions
 - Removing existing functions
 - Changing functions
 - Correcting errors and improving performance
- But
 - Source code modification without refactoring
 - Copy-and-modify reuse

Traditional Software Engineering

- Copy-and-modify reuse

Software Product Line Engineering

As the results

- Proliferation of versions
- Design and code decay
 - Bad structure
 - Spaghetti code
 - Unused code
 - Brittle code
- Software maintenance can cost as much as 80% of the entire lifecycle cost

The problem

- Software is developed like hardware
- There is little effort to build “Softness” into software
- The traditional approach can no longer support development of products with
 - Diverse market needs
 - Time-to-market pressure
 - Fierce feature competition

Software Product Line Engineering

Softness of Software

■ Why important

- Functionality of products implemented as software (e.g., more than 10M lines of code for TV products)
- Diverse market needs
- Time-to-market pressure (e.g., new TV models every 3-6 months)
- Software as valuable asset of an organization
 - Accumulated systems development knowledge is packaged as reusable asset

POSTECH
Copyright © 2013
SE Lab., Dept. of CSE
POSTECH, R.O. Korea

10

Softness of Software

■ Softness

- Maintainability
- Adaptability
- Portability
- Interoperability
- Reusability

POSTECH
Copyright © 2013
SE Lab., Dept. of CSE
POSTECH, R.O. Korea

11

Software Product Line Engineering

Related engineering principles and techniques

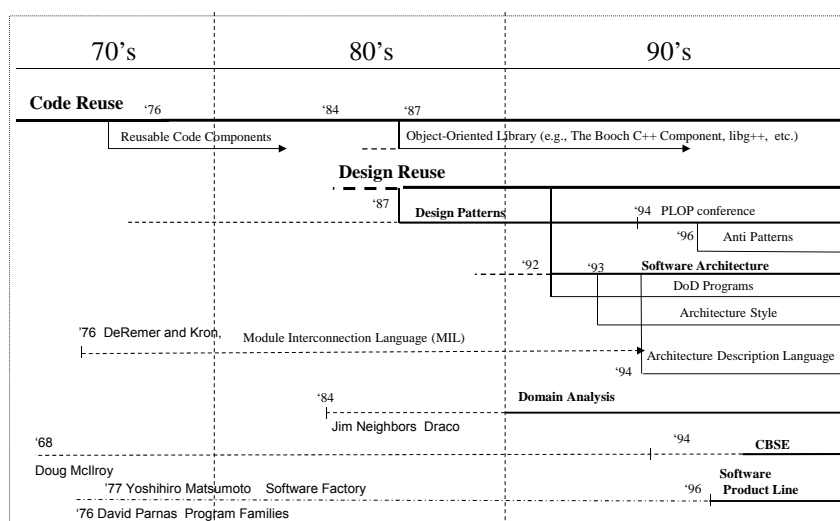

- Modularity
- Abstraction
- “Layering”
- David Parnas’
 - Information hiding
 - Program families
- Meta programming and application generators
- There are many mechanisms to use; How do we know what to “hide”

POSTECH

14

Product Line Engineering

- Systematic Reuse in the Context of a Product Line: **“Building softness into software”**
 - Product line: “a family of systems sharing a common set of features”

POSTECH
Copyright © 2013
SE Lab., Dept. of CSE
POSTECH, R.O. Korea

15

Software Product Line Engineering

 Software Product Line Engineering (SPLE) is an emerging software engineering paradigm, which guides organizations toward the development of products from core assets rather than the development of products one by one from scratch.

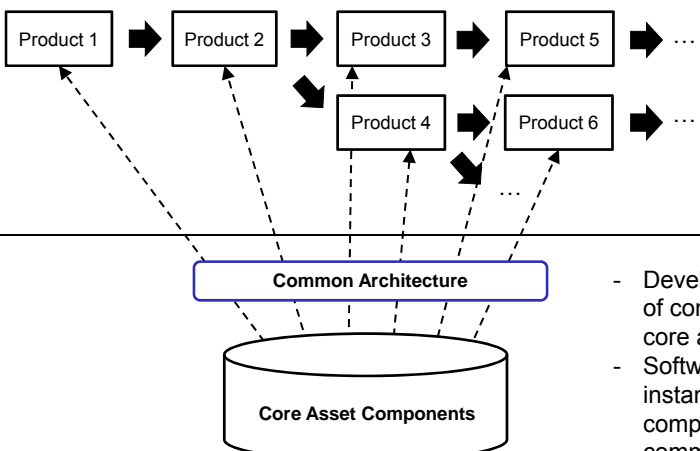

POSTECH
 Copyright © 2013
 SE Lab., Dept. of CSE
 POSTECH, R.O. Korea

16

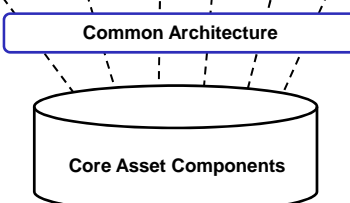

Product Line Software Engineering

Traditional Software Engineering

- Development and maintenance of many similar software products
- High software maintenance cost

Software Product Line Engineering

- Development and maintenance of common architecture and core asset components
- Software products are instantiated from the core asset components based on the common architecture
- High reusability and low software maintenance cost

■ Important technical elements of product line engineering

- Commonality and Variability
- Architecture (structure, “bone”)
 - Stability based on common properties
- Variation points and Variants
 - Flexibility based on expected variations
- Encapsulation of design decisions that may change
 - Information hiding, abstraction, etc.

Software Product Line Engineering

Technical Advances

- Paradigm change
 - From single systems to product line/family
 - “Good software engineering” focusing on maintainability and reusability
- Commonality and variability analysis
 - Feature analysis
- Domain-oriented Architectures and Components (from objects and collaborations)
 - Variation points and variants
 - “high option potentials”
- Domain specific languages and generators

Basic Principles

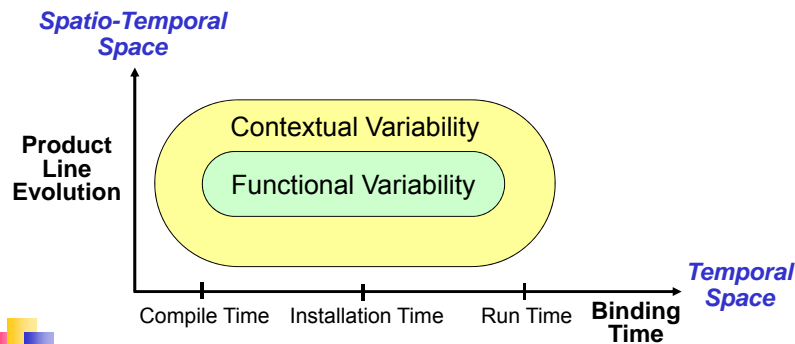

- How do we develop product line software?
 - **Variability analysis: Think about what may change!**
 - Looking across a family of applications in the product line
 - In different markets
 - Looking ahead for anticipated changes
 - Expected requirements from a market analysis
 - Emerging markets
 - Study of emerging technologies
 - Exploring product usage contexts
 - Both static and dynamic dimensions
 - **Building variability into software**
 - Architecture: Variation points and variants
 - Component: Hide (encapsulate) design decisions that may change!
 - Abstract and expose unchanging functional properties as interface!

Software Product Line Engineering

Commonality and Variability

- Functional Variability
- Contextual Variability
- Binding Time Variability
- Evolution of Functional and Contextual Variability

Software Product Line Engineering

Contextual Variability

Product contexts

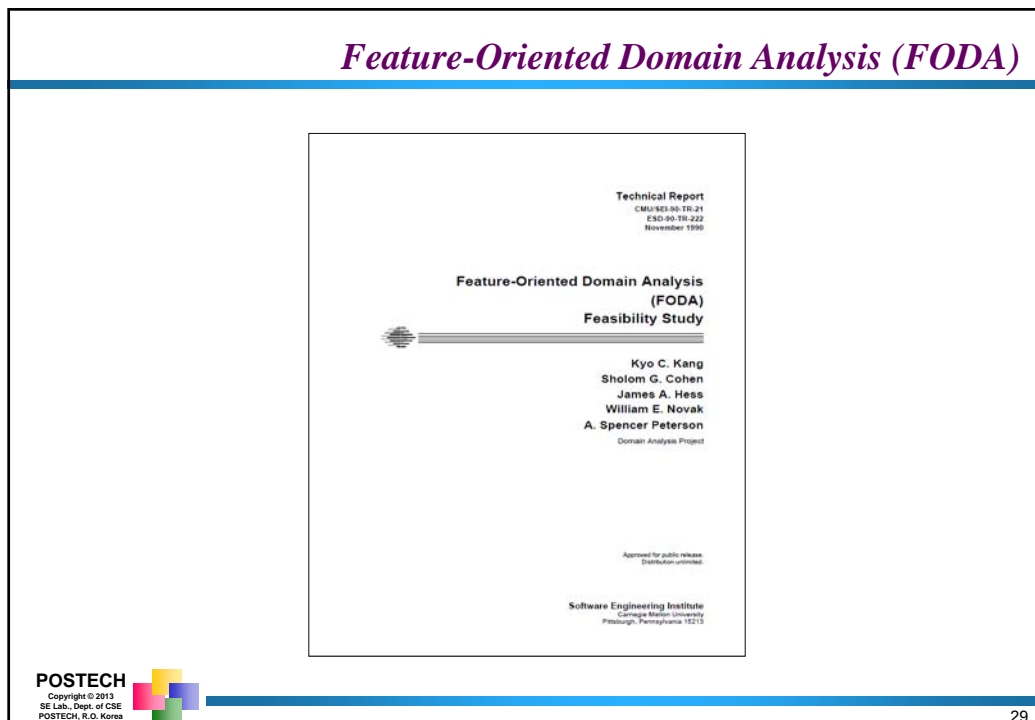

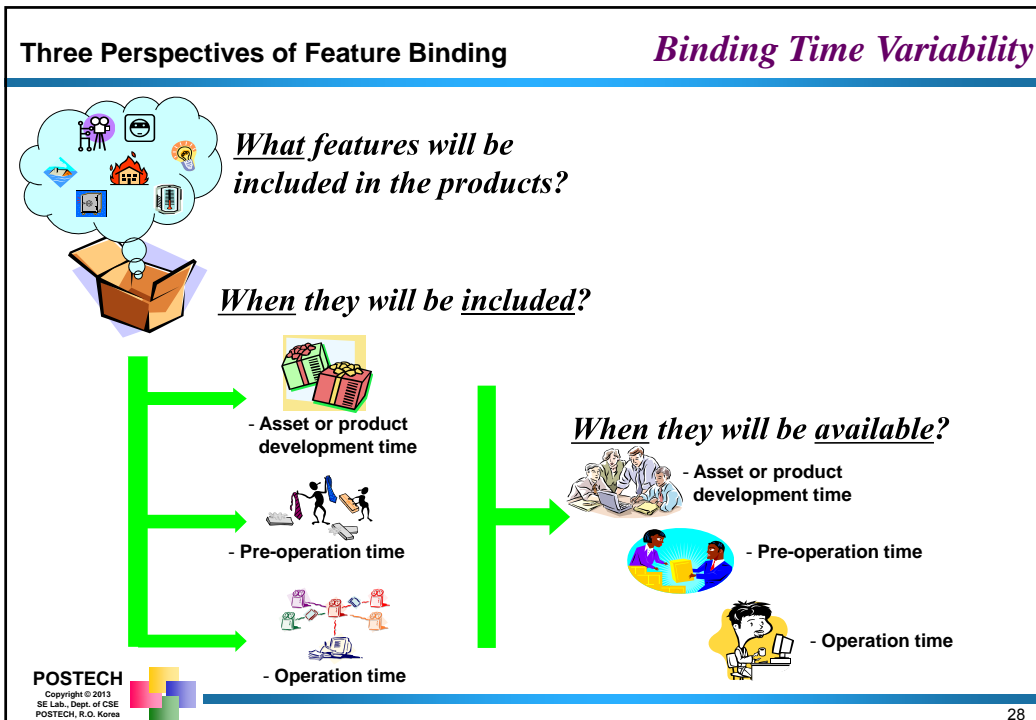

- Different/evolving operating environments (e.g., technologies)
- Different legal and cultural constraints
- Different marketing strategies
- Different/ evolving market needs
- Dynamically changing usage contexts

Usage Context Example: Elevators

Contextual Variability

Feature-Oriented Domain Analysis (FODA)

VaMos Fourth International Workshop on Variability Modelling of Software-intensive Systems "Celebrating 20 Years of Feature Models"

Johannes Kepler University Linz, Austria — January 27-29, 2010

13th International Software Product Line Conference (SPLC)

August 24-28, 2009 | Airport Marriott, San Francisco, CA, USA

Kyo Chul Kang, Ph. D.

FODA: Twenty Years of Perspective on Feature Models

After receiving his Ph.D. from the University of Michigan in 1982, Dr. Kang worked as a visiting professor at the University of Michigan and as a member of the technical staff at Bell Communications Research and AT&T Bell Laboratories. He joined the Carnegie Mellon Software Engineering Institute as a senior member of the technical staff in 1987. He is currently a professor at the Pohang University of Science and Technology (POSTECH) in Korea. He served as director of the Software Engineering Center at the Technology Promotion Agency (KIPA) from 2001 to 2003. Also, general chair for the 8th International Conference on Software Reuse (Machri, Spain) in 2004 and as general chair for the 11th International conference (SPLC 2007) held in Kyoto, Japan in 2007.

At the University of Michigan, he was involved in the development of requirements engineering tool system, and a Meta modeling language. His research has focused on software reuse. While on leave from POSTECH, he was involved in the development of the use of the SEPA Capability Maturity Model (CMM) in current research areas include software reuse and product line requirements engineering, and computer-aided software engineering.

Software Product Line Engineering

Software Product Line Engineering

Example: Elevator Control System

Real World Problem

Real World Problem:

Context:

The number of floors of multistory buildings is increasing.

Problem:

Moving objects between floors becomes difficult.

Example: Elevator Control System

Problem Space Features

■ Goal/objective features

- Represent what a system should achieve in order to solve real world problems.
- Important to determine the scope of a product line.
 - Product line analysts, market analysts, and developers can establish an explicit boundary of a product line and can share a common understanding about the ultimate goals of the product line.

“Moving objects between different floors of a building in an efficient way.”

Refined to

“Moving objects between different floors of a building **vertically** in an efficient way **using a cage with doors**.”

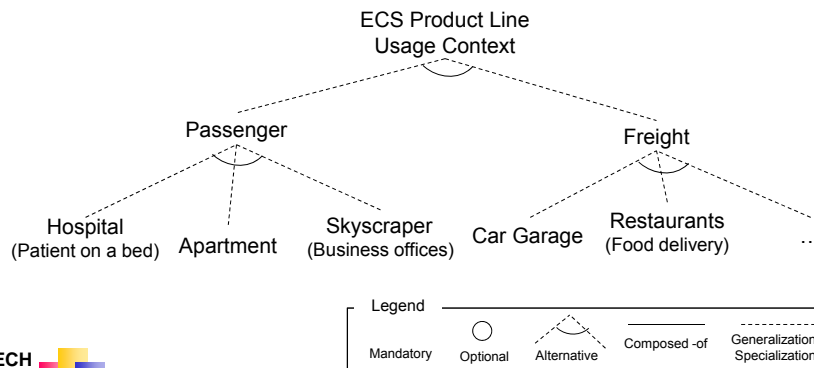

Software Product Line Engineering

Example: Elevator Control System

Problem Space Features

■ Usage context features

- Represent any contextual setting in which a product is deployed and used.
- Include physical environments, user profiles, social or legal issues, business concerns, etc.

Software Product Line Engineering

Marketing Plan

A **marketing plan** includes a **market analysis** with an assessment of the market, and a **marketing strategy** with a plan for realizing the business opportunities with products that meets the needs.

The **market analysis** includes:

- need assessment
- customer profiles
 - end-user skill levels
 - cultural and legal constraints
- business opportunities
 - price range
 - time to market

The **marketing strategy** may initially include:

- an outline of product delivery methods : how the products will be delivered to customers

POSTECH

POSTECH, R.O. Korea

54

Elements of MPP

Product Line Initiation

Marketing Plan (Business Concerns)

Market analysis

- Market segment
 - Needs assessment
 - User profile
 - Cultural and legal constraints
- Business opportunities
 - Time to market,
 - Price range, etc.

Marketing strategy

- Product delivery methods
- Other business considerations

Product Plan (Engineering Concerns)

Product features

- Product functional features
 - Feature lists
 - Feature description
- Non-functional features
 - Usability, scalability, etc.

Product features delivery methods

- Feature coverage
- Feature binding time
- Feature binding techniques

Software Product Line Engineering

**FORM Application:
Elevator Control System (ECS) Product Line**

56

Product Plan

Once the marketing plan has been defined, it is important to spend some effort on **identifying the characteristics** of products in a product line in terms of features and **developing a plan for incorporating features**.

The **product plan** includes

- Product features:
- Product feature-delivery methods:
- Feature release plan for future:

Software Product Line Engineering

MPP for ECS Product Line

Product Line Initiation

Marketing and Product Plan for ECS Product Line			
Market Segments	High-Rise Office Building	General Hospital	Apartment
User/Maintainer Profile	Dedicated engineers with computer science backgrounds.	No computer knowledge is assumed.	No computer knowledge is assumed.
Legal Constraints	Because an elevator is part of a building, it must comply with standards relating to earthquake resilience, fire standards, electrical wiring rule, and etc.		
Feature Delivery Method	Feature selection from a predefined set of features (Feature Selection Method)	Prepackaged Method	Prepackaged Method
Product Features	Call Handling, Indication Handling, Door Control, Motor Control, Car Call Cancellation, Group Management, etc.	Call Handling, Indication Handling, Door Control, Motor Control, Emergency Driving, Hospital Emergency, etc.	Call Handling, Indication Handling, Door Control, Motor Control, etc.
Quality Attributes	Door Safety, Usability, Efficiency	Door Safety, Usability, Smooth and Comfortable Run, Position Accuracy	Door Safety, Usability
Product Feature Binding Time	Product Delivery Time	Product Build Time	Product Build Time

Software Product Line Engineering

Software Product Line Engineering

What is Product Development?

Product Development

- Product development is a process of developing a specific product making use of the product line asset developed during the product line asset development process.
- Product development proceeds by:
 - analyzing user's requirements,
 - selecting appropriate and valid product line features from the feature model,
 - identifying the corresponding architecture models,
 - completing the product development by reusing software components, and
 - adapting components as needed.

Software Product Line Engineering

72

Process

Adoption Issues

- How to change to PL-based organization
 - How to evolve: staged process model for reuse adoption
 - Key process areas
 - Best practices
 - Metrics
 - Key indicators: cost of production, time to market, project completion time, etc.
 - Relationship between reuse, quality, and productivity
 - Relationship between reuse and ROI for sustainability of a reuse program
- Process models
 - Proactive vs. reactive vs. extractive models
 - Best practices
 - PL process vs. agile methods
